# Database design for healthcare system

Dr Kanida Sinmai  
Department of Computer and Information Technology  
Faculty of Science

# Course Outline

## What is Database

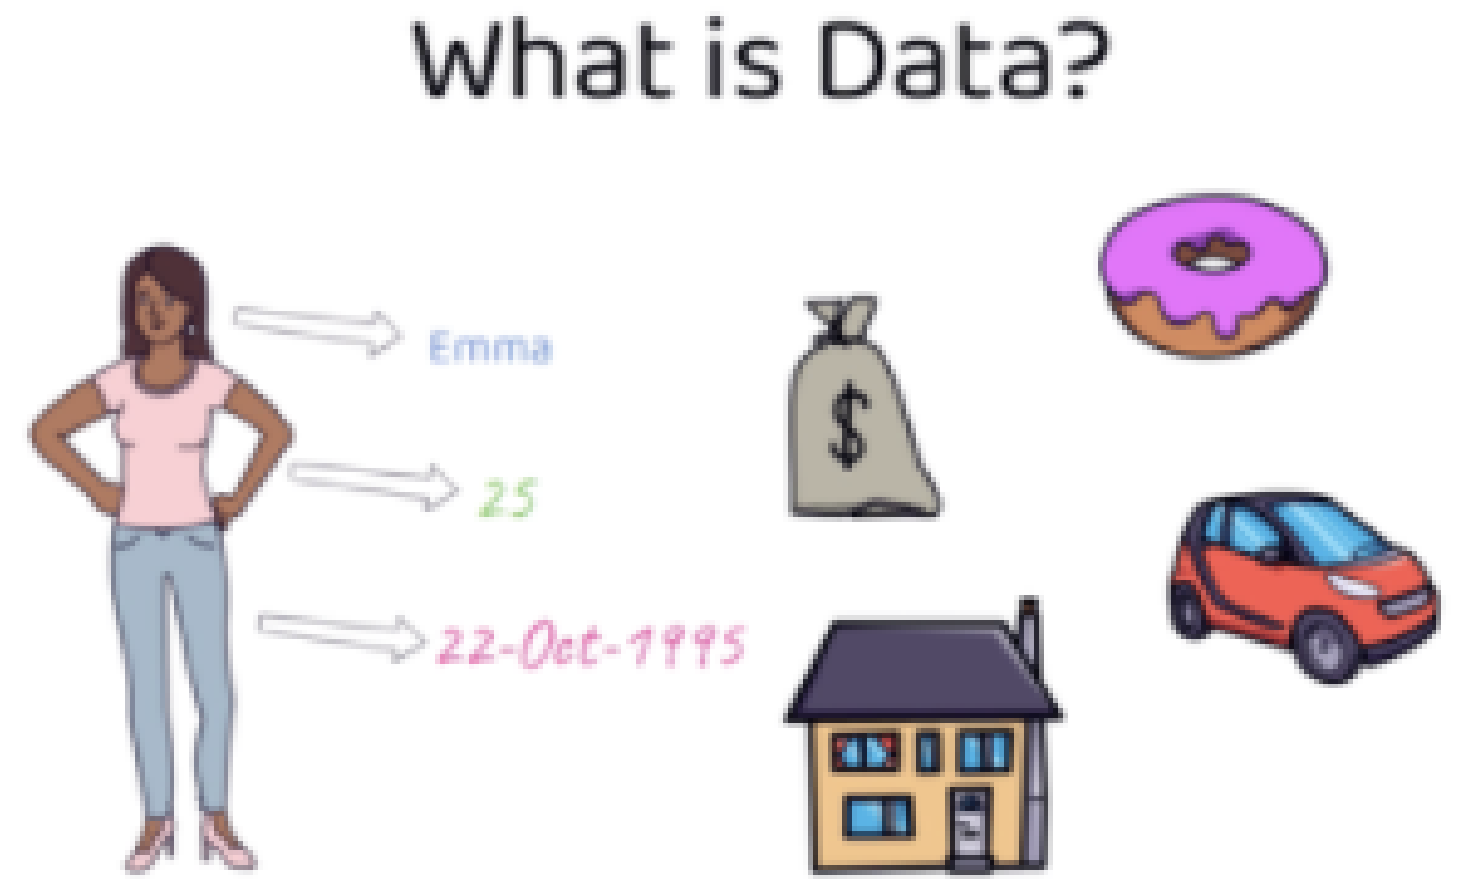

## Practical

## What is DATA?

In general, **data** is any set of **characters** that is gathered and translated for some purpose, usually analysis.

If data is not put into context, it doesn't do anything to a human or computer.

# Types of data

- Single character
- Boolean (true or false)
- Text (string)
- Number (integer or floating-point)
- Picture
- Sound
- Video

# DATA

In a computer's storage, digital data is a series of **bits** (binary digits) that have the value **one** or **zero**.

Data is processed by the **CPU**, which uses logical operations to produce **new data** (**output**) from **source data** (**input**).

# What is Database?

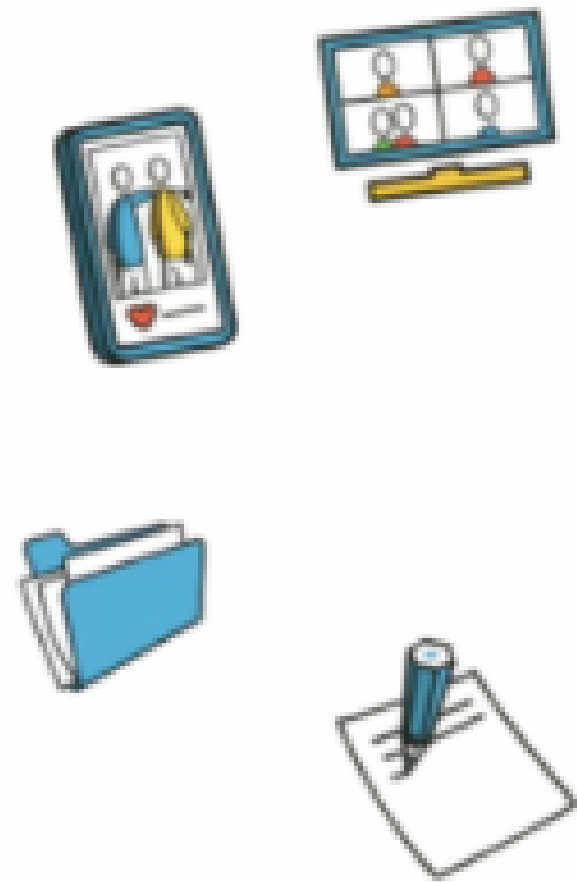

- A collection of organized information on a particular subject.
- It is organized so that queries and reports based on the information can be readily performed.
- Common examples of databases:
  - telephone book
  - Student records

		<b>Total</b>	<b>8:30</b>		

# What is DBMS?

A **d**atabase **m**anagement **s**ystem is a collection of software for managing the database and contains software for organizing the data and verifying it, as well as software for retrieving the data through queries as well as creating reports based on the data.

DBMS  $\neq$  DATABASE ?

# DBMS

Fast forward to 2020,  
In today's world, there are mainly  
2 popular database types.

- Relational Database
- Non-Relational Database (or NoSQL Database)
